

WHAT WE DO

As a company we are conscious about how we operate in everything we do.

We are serious about making music accessible and fun, and consider the impact of everything we do. We also unusually make our instruments out of plastic, which our customers often ask about, so thought we would share how we look at reducing our impact on the environment.

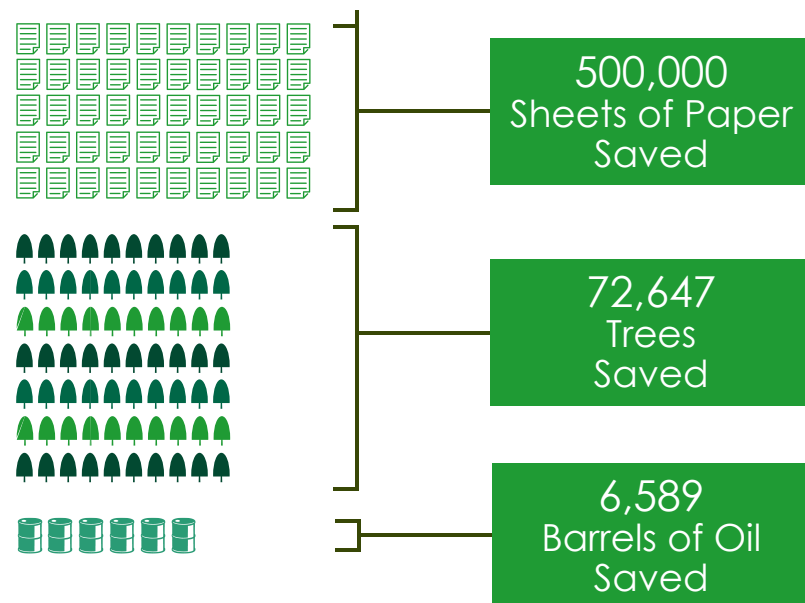

REDUCE

Our instruments are made using ABS plastic. The resources used in the production of plastic instruments are much less than that of traditional brass equivalents which are mainly manufactured from yellow brass.

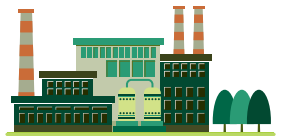

Every time we make an instrument out of plastic rather than brass, we reduce the amount of carbon used. In fact, compared with brass instruments the 500,000 instruments we have manufactured since 2010 have saved 2,833,247 kg's of CO2.

REUSE

During the manufacturing process it is not uncommon for excess materials to be left over. The great thing about ABS plastic is that those bits that we don't use are simply melted down and re-used; minimal waste!

Our instruments are pretty indestructible! However, if there is an individual part of an instrument that is broken we can provide many replacement parts!

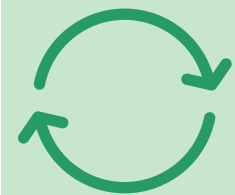

If you have an instrument that you are no longer using, why not pass it on to a friend or family member and encourage someone else to experience the joy of music!
